

Shaarli

I like [Shaarli](#) is a lightweight, self-hosted bookmarking tool perfect for those who prefer to save, organise and share web links on their own terms. Instead of relying on a commercial bookmarking service, Shaarli allows you to keep your collection of links on your own server, giving you more control over your data and how it is used. It is especially appealing to users who like simple tools that do one job well without a lot of extra noise.

At its core, Shaarli is about keeping track of useful links in a clean and efficient way. You can save pages you want to revisit, add tags or notes to help organise them and browse your collection later without digging through browser history like a raccoon searching a recycling bin. It is designed to be fast and straightforward, making it easy to manage a personal knowledge stash or a curated list of resources.

One of Shaarli's biggest strengths is its privacy and independence. Because it is self-hosted, your bookmarks are stored on infrastructure you control rather than on a third-party platform. That makes it a good fit for people who care about ownership, simplicity and avoiding ad-driven services. It can also be useful as a public link collection, a personal reference library or even a shared resource page for a team or community.

In short, Shaarli is a practical bookmarking platform for people who want a simple, private and self-managed way to store links. It combines ease of use with full control, making it a solid choice for anyone who wants their bookmarks to live somewhere they actually own.
